NHATS Memorandum #1

Recalculation of Weights for NHATS Rounds 5 and 6 and NSOC II

December 12, 2017

## Introduction

The initial NHATS cohort was first interviewed in 2011 and was designed to support weighted analysis of Medicare beneficiaries ages 65 and older living in the contiguous United States on September 30, 2010. This initial cohort has been interviewed annually. In Round 5, the sample was replenished by 5-year age groups and race (black and nonblack). The replenishment sample was drawn from Medicare beneficiaries enrolled as of September 30, 2014.

Starting in Round 5, separate sets of weights were developed to enable analyses of the initial cohort population (the "2011 Cohort"), as well as for analyses of the replenished Round 5 population (the "2015 Cohort"). For each cohort, two types of sampling weights have been produced (variable names start with w and are followed by round number e.g. 5; 2011 in the name indicates 2011 Cohort weight): a tracker weight (on the Tracker file with the variable names w5trfinwgt0 and w5tr2011wgt0) and an analytic weight (on the Sample Person file with the variable names w5anfinwgt0 and w5an2011wgt0). For variance estimation, NHATS has also included replicate versions of these weights (w5trfinwgt1-w5trfinwgt56 and w5an2011wgt1-w5tr2011wgt56 and w5an2011wgt1-w5tr2011wgt56 for the 2015 Cohort; w5tr2011wgt1-w5tr2011wgt56 and w5an2011wgt1-w5an2011wgt56 for the 2011 Cohort).

A miscalculation of the weights for a small number of cases in the 2015 replenishment sample (n = 130 respondents; n = 211 sampled cases) was discovered in November 2017, which led to recalculating the analytic and tracker weights for the 2015 Cohort in both Rounds 5 and 6. NSOC II weights also were recalculated. Weights for the 2011 cohort were not affected. This technical note provides background on the miscalculation that occurred and its effects on the computation of the weights, as well as tables and graphs evaluating differences in several key estimates using the original and recalculated weights. Based on evaluations shown here, the magnitude of the change in estimates using the original and recalculated weights is small (see Appendix 1 and 2).

# Background on Computation of the 2015 Cohort Round 5 and 6 Weights and the NSOC II Weights

# **Tracker Weights**

In computing the 2015 Cohort tracker weights starting in Round 5, it was important to recognize the substantial overlap between persons eligible for the initial cohort in 2011 (those 65 or older, residing in the U.S., and enrolled in Medicare as of September 30, 2010) and persons eligible for the replenishment sample in 2015 (those 65 or older, residing in the U.S., and on Medicare as of September 30, 2014). Compositing, a weighting approach that essentially averages the weights of units from two or more independent samples that represent the same population, was used to account for this overlap for persons who were eligible for the replenishment sample in 2015. (See DeMatteis, Freedman, and Kasper 2015 and 2017 for details on the specific methodology used in computing and adjusting the Round 5 and Round 6 weights).

For persons eligible for both samples, the compositing step adjusted the weights by the factor

$$\gamma = \frac{neff_S}{neff_{orig} + neff_{replen}}$$

where  $neff_{orig}$  and  $neff_{replen}$  are the effective sample sizes (accounting for unequal weighting design effects) for the original sample and the replenishment sample, respectively, based on the weights that were used as input to the compositing process, and  $neff_S$  is the effective sample size for the sample into which the beneficiary was selected (either  $neff_{orig}$  or  $neff_{replen}$ ).

To produce the 2015 Cohort Round 5 tracker weights, two additional adjustments were made to the weight—an adjustment for Round 5 nonresponse and a raking adjustment to estimated population totals from the Medicare Enrollment DataBase. Similar adjustments were made in computing the Round 6 weights (beginning with the Round 5 nonresponse adjusted tracker weights).

#### **Analytic Weights**

As for the tracker weights, separate analytic weights were computed starting in Round 5 for the 2015 Cohort (designed for analysis of the total sample consisting of both initial and replenishment cases) and for the 2011 Cohort (designed for analysis of the initial sample alone). The computation of the analytic weights begins with the tracker weight for the respective cohort. These weights are then adjusted for sample person interview nonresponse among completed cases (i.e., persons residing in facilities who were eligible for but did not complete the NHATS SP interview). As a final step, a raking procedure is applied so that marginal totals based on the analytic weights match the totals from the Medicare Enrollment Database at the time of sample replenishment (September 30, 2014).

#### **NSOC II Weights**

The calculation of the NSOC II weights began with the NHATS 2015 Cohort analytic weight. For caregivers in networks with more than 5 eligible caregivers, the NHATS analytic weight was adjusted for caregiver subsampling (by multiplying the number of eligible caregivers divided by 5). Next, a 2-step weighting class adjustment for nonresponse was applied. A 2-step adjustment was used because there were two opportunities for NSOC interview nonresponse with potentially different mechanisms for nonresponse—nonresponse due to refusal to provide contact information by the NHATS Sample Person and non-response to the NSOC interview by caregivers (among caregivers for whom contact information was provided).

#### Miscalculation introduced in the weight compositing step

Two groups were eligible for compositing in developing the 2015 Cohort Weight because they were eligible for the sample in both 2011 and 2015. The first group, eligible for compositing, was persons in the 2011 initial sample. The second group consisted of persons in the 2015 replenishment sample who also met sample eligibility criteria as of Sept. 30, 2010. A small number of cases in the second group, however, should not have been included in compositing, because although enrolled in Medicare on the date of the initial sample selection, they were less than 65 years of age at that time, thus were not eligible for the initial sample. As of the 2015 sample replenishment these individuals were 65 to 68 years of age, and met other eligibility criteria for sample selection.

A total of 211 cases, 130 of whom were respondents at Round 5 in 2015, were incorrectly included in the compositing step for the tracker and analytic weights, respectively, in Round 5. Inclusion of these cases in compositing at Round 5 also carried over to computation of the Round 6 weights and the NSOC II weights. All cases included in compositing contribute to the compositing factor and to the subsequent weight adjustments, so although only a small number of cases were included incorrectly, removing these cases from the compositing step resulted in changes when the weights were recalculated for Rounds 5 and 6 and NSOC II. Since the compositing step is not relevant to the 2011 Cohort weights introduced starting in 2015, these weights were not affected.

# Recalculated weights and evaluation of effects on key estimates

A "Version 2" of the 2015 and 2016 data files, and NSOC II files, have been produced with recalculated weights that correct for the miscalculation at the compositing step. We recommend that NHATS and NSOC Users download these data files.

Minor revisions also have been made to technical papers (DeMatteis, Freedman and Kasper, 2016a, 2016b, 2017) and the User Guides (Kasper and Freedman, 2017; Kasper, Freedman, and Spillman, 2017) to reflect changes related to the recalculated weights.

In order to evaluate the effect on estimates of using the recalculated versus the original weights, we examined differences for several key variables. Appendix I provides graphs showing the distribution of changes in estimates between the original and recalculated weights for NHATS Rounds 5 and 6 (42 variables overall and within 5-year age groups) and NSOC II (43 variables). Most differences are minimal, between 0 and <.05. Differences between .05 and <.1 are slightly higher in Round 6 compared to Round 5, but overall differences are concentrated in the lowest range. This holds true across 5-year age groups although some variation in the distribution of differences is observed. Appendix II provides more detailed tables showing estimates using both the original and recalculated weights for key variables from Rounds 5 and 6 of NHATS and NSOC II and the magnitude of change between the two.
